### MAIN DOMAIN OF RESEARCH

My research interests focus in the area of biochemistry at the interface between biological, catalytic and inorganic chemistry. With my group we are interested in studying metalloenzymes, in particular copper containing oxidases, that we functionalize with different nano-objects (e. g. transition metal complexes) to obtain hybrid catalysts with original properties. We are currently developing the following research topics: 1) bioinspired photo-oxidases allowing a renewable Oxygen Atom Transfer Reaction, 2) original hybrid Pd-based oxygenases as novel catalysts for environmentally friendly industrial processes, 3) surface-ordered enzyme for high performance bio-cathodes, and 4) surface-oriented enzyme grafted nanoparticles for renewable bio-catalysts with an efficient control of the selectivity.
